| SUBJECT: BIOENGINEERED TISSUE PRODUCTS FOR WOUND TREATMENT AND SURGICAL INTERVENTIONS POLICY NUMBER: 7.01.35 CATEGORY: Technology Assessment | EFFECTIVE DATE: 01/17/02 REVISED DATE: 01/16/03, 03/18/04, 01/20/05, 03/16/06, 12/21/06, 01/17/08, 02/19/09, 05/27/10, 08/18/11, 08/16/12, 07/18/13, 11/20/14, 12/17/15, 2/16/17, 04/19/18 PAGE: 1 OF: 22 |
| <ul style="list-style-type: none">• <i>If a product excludes coverage for a service, it is not covered, and medical policy criteria do not apply.</i>• <i>If a commercial product (including an Essential Plan product) or a Medicaid product covers a specific service, medical policy criteria apply to the benefit.</i>• <i>If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.</i> | |

POLICY STATEMENT:

- I. Based upon our criteria and review of the peer-reviewed literature, bioengineered tissue products have been proven to be medically effective and are **medically appropriate** for the treatment of *venous ulcers of the lower extremities* and for *diabetic foot ulcers* that have not responded to a comprehensive program of wound care. Only products that have received FDA approval for this purpose are considered medically appropriate.
- A. For treatment of *venous ulcers*, Apligraf® or Oasis™ Wound Matrix may be used when all of the following criteria are met:
1. The patient has adequate arterial blood supply as evidenced by ankle-brachial index (ABI) of 0.65 or greater in the limb being treated;
 2. The patient is competent and/or has support system required to participate in follow-up care associated with treatment with a bioengineered tissue product;
 3. Ulcers are partial or full thickness and of greater than three (3) months duration;
 4. Ulcers have failed to respond to conservative measures of at least one (1) month duration that have, at a minimum, included regular dressing changes, debridement of necrotic tissue, and standard therapeutic compression. (“Failure to respond” is defined as increase in size or depth or no change in size or depth with no sign or indication that improvement is likely, such as granulation, epithelialization, or progress toward closing);
 5. Patient has adequate treatment of the underlying disease process(es) contributing to the ulcer; and
 6. Ulcers are free of infection, redness, drainage, underlying osteomyelitis, surrounding cellulitis, tunnels and tracts, eschar or any necrotic material that would interfere with adherence of a bioengineered tissue product and wound healing.
- B. For treatment of *diabetic foot ulcers*, AlloPatch® Apligraf®, Dermagraft®, Oasis™ Wound Matrix, or Integra™ Dermal Regeneration Template® (Omnigraft™) may be used when all of the following criteria are met:
1. The patient has adequate arterial blood supply as evidenced by ankle-brachial index (ABI) of 0.65 or greater in the limb being treated;
 2. The patient is competent and/or has support system required to participate in follow-up care associated with treatment with a bioengineered tissue product;
 3. Ulcers are full thickness and of greater than three (3) weeks duration which extend through the dermis but without tendon, muscle, capsule or bone exposure;
 4. Patient has adequate treatment of underlying disease process(es) contributing to the ulcer;
 5. Ulcers are located on foot or toes and are free of infection, redness, drainage, underlying osteomyelitis, surrounding cellulitis, tunnels and tracts, eschar or any necrotic material that would interfere with adherence of a bioengineered tissue product and wound healing; and
 6. Patient’s current HbA1C does not exceed 12%.
- II. Based upon our criteria and review of the peer-reviewed literature, the use of allogeneic human acellular dermal matrix (ADM) products (e.g., AlloDerm®, AlloMax™, Cortiva™ (formerly known as AlloMax), DermaCELL AWM™, DermaMatrix™, FlexHD®, GraftJacket®) is **medically appropriate** for breast reconstruction surgery following surgical mastectomy.

| <p>SUBJECT: BIOENGINEERED TISSUE PRODUCTS FOR WOUND TREATMENT AND SURGICAL INTERVENTIONS</p> <p>POLICY NUMBER: 7.01.35</p> <p>CATEGORY: Technology Assessment</p> | <p>EFFECTIVE DATE: 01/17/02</p> <p>REVISED DATE: 01/16/03, 03/18/04, 01/20/05, 03/16/06, 12/21/06, 01/17/08, 02/19/09, 05/27/10, 08/18/11, 08/16/12, 07/18/13, 11/20/14, 12/17/15, 2/16/17, 04/19/18</p> <p>PAGE: 2 OF: 22</p> |
|--|---|

- III. Based upon our criteria and review of the peer-reviewed literature, the use of AlloDerm® is considered **medically appropriate** for the following indications:
- A. Nasal repairs (e.g., septal repair, septal perforation repair, reconstructive septorhinoplasty), and
 - B. Non-primary hernia repair when chronic infection contraindicates the use of mesh or other conventional repair; and
 - C. Parotidectomy.
- IV. Based upon our criteria and review of the peer-reviewed literature, Biobrane®, Epicel®, Integra® Dermal Regeneration Template, have been proven to be medically effective and are therefore **medically appropriate** for the treatment of *burns*.
- A. For the treatment of *severe* full-thickness burns (e.g. greater than or equal to 20% total body surface area and/or excision to the fascia to remove all nonviable tissue) or deep partial-thickness thermal injury using Integra® Dermal Regeneration Template, all of the following criteria must be met:
 1. The patient is competent to understand the need for immobilization and the need for a second surgical procedure for application of an ultra-thin epidermal graft, regular follow-ups, and rehabilitation;
 2. Insufficient autograft is available at the time of burn excision; and
 3. The burn site is free of residual eschar.

The use of Integra® Dermal Regeneration Template is contraindicated for patients with the following:

 - A. Known hypersensitivity to bovine collagen, silicone, or chondroitin materials;
 - B. Pregnancy;
 - C. Clinically diagnosed infected wounds.
 - B. For the treatment of thermal injuries, superficial scald burn or flame injury of the hand using Biobrane®, all of the following criteria must be met:
 1. The patient is competent and/or has the support system required to participate in follow-up care associated with treatment with a bioengineered tissue product;
 2. The burn is superficial, partial-thickness with limited involvement of the dermis (less than or equal to 25% total body surface area);
 3. The burn is clean, non-infected, and free of nonviable tissue and coagulation eschar; and
 4. The patient is competent to understand the need for immobilization.
- V. Based upon our criteria and the lack of peer-reviewed literature, all other bioengineered tissue products have not been proven medically effective and are considered **investigational** for all other applications. These products include, but are not limited to, the following:
- ACell® UBM Hydrated/Lyophilized Wound Dressing
 - Affinity™
 - Alloderm for use in tympanoplasty
 - AlloSkin™
 - AlloSkin™ RT
 - AlloSource cryopreserved human cadaver skin
 - AlloWrap™
 - AmbioDisk® (IOP Ophthalmics)
 - AmbioDry5® (IOP Ophthalmics)
 - AmnioBand™
 - AmnioCare
 - AmnioExCel®
 - AmnioFix
 - AmnioGenix
 - AmnioHeal amniotic membrane
 - AmnioMatrix®
 - AmnioMTM
 - AmnioShield
 - AmnioStrip
 - Amniotic fluid injection for corneal wound healing and prevention of adhesions after orthopedic surgery
 - Amniox (human embryonic membrane) for tarsel tunnel repair and all other indications
 - Aongen™ Collagen Matrix

Refer to the Description section for further information in regard to the products listed in the Policy Statements.

Refer to Corporate Medical Policy #1.01.38 regarding Negative Pressure Wound Therapy (Vacuum Assisted Closure).

Refer to Corporate Medical Policy #2.01.24 regarding Growth Factors for Wound Healing and Other Conditions.

Refer to Corporate Medical Policy #10.01.01 regarding Breast Reconstruction Surgery.

Refer to Corporate Medical Policy #11.01.03 regarding Experimental or Investigational Services.

This policy does not address fibrin sealants (e.g., Tisseel).

POLICY GUIDELINES:

- I. Utilization of specific products are medically appropriate only when used in accordance with FDA product approval and when the above policy criteria are met.
- II. If a wound has not responded to standard of care by achieving a 50% closure after 4 weeks of standard of care, a single application of a bioengineered tissue product was thought to be all that was required to affect wound healing in wounds likely to be improved by this treatment. Based on clinical input from wound specialists, refractory wounds rarely heal with one graft application and may require additional graft application every week until the wound heals. Re-application of a product is appropriate only if there has been measurable response to the first application. Re-application in less than one year after successful treatment is not medically appropriate
- III. Treatment of venous stasis ulcers that extend above the malleoli is beyond the scope of practice of podiatrists.
- IV. The Federal Employee Health Benefit Program (FEHBP/FEP) requires that procedures, devices or laboratory tests approved by the U.S. Food and Drug Administration (FDA) may not be considered investigational and thus these procedures, devices or laboratory tests may be assessed only on the basis of their medical necessity.

DESCRIPTION:

Bioengineered tissue products are used for burns, chronic wounds, and rare skin diseases and are proposed for use in many other conditions. They aid in the growth of new skin or serve as a temporary cover until other grafts can be placed.

Bioengineered tissue products and their uses/ proposed uses include, but are not limited to:

| <u>Biologic tissue product</u> | <u>Class</u> | <u>Use/Proposed Use</u> | <u>FDA approved*</u> | <u>FDA exempt**</u> |
|---|---|--|----------------------|---------------------|
| *PMA - Wound and burn dressings, class III high risk devices and require clinical data to support claims for use. | | | | |
| *510(k) - Wound care devices that protect wounds and act as a scaffold for healing. | | | | |
| **Human tissue - Donated, banked human skin regulated by the American Association of Tissue Banks and FDA guidelines. | | | | |
| Affinity™ | Human amniotic tissue membrane | Wound care | | Human tissue |
| AlloDerm® | Acellular dermal matrix; allogeneic human derived decellularized skin | Burns, wound healing, contaminated abdominal walls, ventral hernia repair, breast reconstruction | | Human tissue |

| <u>Biologic tissue product</u> | <u>Class</u> | <u>Use/Proposed Use</u> | <u>FDA approved*</u> | <u>FDA exempt**</u> |
|----------------------------------|---|---|----------------------|---------------------|
| AlloMax™ (previously NeoForm™) | Acellular dermal matrix; allogeneic human derived decellularized skin | Breast reconstruction | | Human tissue |
| AlloSkin™ | Epidermal and dermal allograft | Partial and full thickness wounds | | Human tissue |
| AlloWrap™ DS or Dry | Human amniotic tissue membrane | Wound care | | Human tissue |
| AmnioBand™ | Dehydrated human placental membrane | Wound care | | Human tissue |
| Amnioexcel® | Human amniotic tissue membrane | Soft tissue repair, wound care | | Human tissue |
| AmnioMatrix® | Human amniotic tissue membrane | Soft tissue repair, wound care | | Human tissue |
| Apligraf® (previously Graftskin) | Cellular, bilayered skin substitute; human derived composite cultured skin | Venous and diabetic ulcers | x (PMA) | |
| ArthroFlex™ (aka FlexGraft) | Decellularized human allograft dermis | Shoulder reconstruction, Achilles tendon repair | | Human tissue |
| Avaulta Plus™ | Porcine derived polypropylene composite | Vaginal wall prolapse | X (510k) | |
| Biobrane®/ Biobrane I® | Synthetic, bilaminate collagen-based composite | Partial thickness burns, temporary covering | x (PMA) | |
| BioDFence® | Human amniotic tissue membrane | Dura repair | | Human tissue |
| Biovance® | Human amniotic tissue membrane | Wound care | | Human tissue |
| Clarix® Flo | Human amniotic tissue and umbilical cord membrane | Integumental tissue repair | | Human tissue |
| Collamend | Porcine derived decellularized collagen | Soft tissue weakness, hernia and abdominal wall repair | X (510k) | |
| Conexa™ | Porcine dermis tissue substitute | Soft tissue repair | x (510k) | |
| Cortiva™ | Acellular dermal matrix; allogeneic human derived decellularized skin | Breast reconstruction | X (510k) | Human tissue |
| Cymetra® | Allogeneic cadaver derived decellularized skin; micronized particulate form of AlloDerm | Soft tissue defects (e.g., laryngoplasty) | | Human tissue |
| Cytal™ Burn Matrix | Porcine collagen wound dressing | Burns | x (510k) | |
| Cytal™ Wound Matrix | Porcine collagen wound dressing | Partial and full thickness wounds, ulcers, surgical and traumatic wounds, burns | x (510k) | |
| DermACELL AWM™ | Decellularized regenerative human tissue matrix allograft | Breast reconstruction | | Human tissue |

| <u>Biologic tissue product</u> | <u>Class</u> | <u>Use/Proposed Use</u> | <u>FDA approved*</u> | <u>FDA exempt**</u> |
|--------------------------------|--|--|----------------------|---------------------|
| Dermagraft® | Interactive wound dressing; human derived composite cultured skin; dermal replacement from neonatal foreskin fibroblasts | Diabetic foot ulcers | x (PMA) | |
| DermaMatrix | Human skin allograft | Facial soft tissue defects, nasal reconstruction, septal perforation, parotidectomy, cleft palate repair, breast reconstruction, abdominal wall repair | | Human tissue |
| DermaPure™ | Single layer, decellularized, dermal allograft | Wound care, diabetic foot ulcers, venous stasis ulcers, wounds refractory to conservative care | | Human tissue |
| DermaSpan™ | Acellular dermal matrix | Repair or replacement of damaged or inadequate integumental tissue | | Human tissue |
| Dermavest™ | Human placental connective tissue matrix | Replace or supplement damaged or inadequate integumental tissue | | Human tissue |
| Endoform Dermal Template™ | Ovine (sheep) derived extracellular matrix | Partial and full thickness wounds, ulcers, surgical and traumatic wounds, burns | x (510k) | |
| ENDURAGEN™ | Porcine dermal acellular collagen matrix | Soft tissue augmentation, reinforcement and repair of the head and face | x (510k) | |
| Epicel® | Cultured epidermal autograft; combined human and animal dermal cellular material | Full thickness burns over greater than 30% of the body | x (HDE) | |
| EpiCord™ | Minimally manipulated lyophilized non-viable cellular umbilical cord allograft | Wound care | | Human tissue |
| EpiFix | Human amniotic tissue membrane | Partial and full thickness diabetic foot, venous leg, arterial and pressure ulcers | | Human tissue |
| Excellagen® | Bovine collagen gel | Partial and full thickness wounds, pressure and venous ulcers, surgical and traumatic wounds | x (510k) | |
| E-Z Derm™ | Porcine derived 6ecellularized fetal skin | Partial thickness burns; venous, diabetic and pressure ulcers | x (510k) | |
| FlexHD® | Acellular dermal matrix | Breast reconstruction, hernia repair | | Human tissue |

| Fortaderm (see PuraPly) | | | | |
| GammaGraft | Irradiated human skin composite allograft | Temporary graft for burns, chronic wounds and partial and full thickness wounds | | Human tissue |
| Glyaderm® | Glycerol preserved acellular human dermis | Wound care | | Human tissue |
| Grafix® CORE | Cellular matrix from human placental chorionic membrane | Acute and chronic diabetic foot ulcers, venous stasis ulcers and pressure ulcers | | Human tissue |
| Grafix® PRIME | Cellular matrix from human placental amniotic membrane | Acute and chronic diabetic foot ulcers, venous stasis ulcers and pressure ulcers; burns; adhesion barriers; and Mohs procedures | | Human tissue |
| GraftJacket® | Bilaminar acellular regenerative tissue; allogeneic human derived decellularized skin | Wound repair, tendon and rotator cuff repair | | Human tissue |
| GraftJacket® Xpress | Micronized decellularized soft tissue scaffold | Deep tunneling dermal wounds | | Human tissue |
| Graftskin (see Apligraf) | | | | |
| Guardian | Dehydrated human placental membrane | Wound care | | Human tissue |
| Hyalomatrix® | Hyaff 11 (hyaluronic acid) and silicone | Partial and full thickness wounds, ulcers, surgical and traumatic wounds, burns | x (510k) | |
| hMatrix® | Acellular dermal matrix | Wound covering, abdominal wall repair, breast reconstruction, craniomaxillofacial soft tissue grafting | | Human tissue |
| Integra™ | Bovine derived tendon collagen and glycosaminoglycan | Partial and full thickness wounds, ulcers, surgical and traumatic wounds, burns | x (510k) | |
| Integra™ Bilayer Wound® Matrix | Bovine-tendon collagen, glucoseaminoglycan and silicone | Partial and full thickness wounds, ulcers, surgical and traumatic wounds, burns | x (510k) | |
| Integra™ Dermal Regeneration Matrix® (Omnigraft™) | Bilayered extracellular cross linked bovine collagen and chondroitin sulfate | Partial and full thickness burns; partial and full thickness diabetic foot ulcers | x (PMA) | |
| Integra™ Flowable Wound® | Granulated cross linked bovine tendon collagen and | Difficult to access and tunneled wounds | x (510k) | |

|--|--|

RATIONALE:

Bio-engineered skin and soft tissue substitutes are being investigated for a variety of conditions. Overall, the number of bio-engineered skin and soft-tissue substitutes is large, but the evidence is limited for any specific product. Relatively few products have been compared with the standard of care, and then only for some indications. Most trials identified were industry sponsored and were open label, with no masking indicating potential performance bias. The data on many of the industry sponsored trials had incomplete outcome data indicating attrition bias. Additional studies with larger number of subjects are needed to evaluate the effect of bio-engineered skin and soft tissue substitutes versus the current standard of care or current advanced wound therapies (i.e. Apligraf® or Dermagraft®). Overall, results of these studies do not provide convincing evidence that many of these products are more effective than SOC or current advanced wound therapies for healing diabetic foot or venous ulcers. Additional trials with a larger number of subjects are needed to determine whether these products improve health outcomes.

A systematic literature review addressing the current application and limitations of biologic dressings in dermatologic surgery was published in June 2009 (Chern, et al). The review was undertaken to review the current evidence regarding the utility, outcomes, and adverse effects of the available biologic dressings, with a particular focus on use in acute surgical wounds and applicability to dermatologic surgery. The authors concluded that although further work is necessary, biologic dressings remain a promising area of study for use in the healing of acute and chronic wounds, many case reports have described the use of various products in dermatologic disease and cutaneous surgery although further study is necessary before conclusions can be drawn, and overall, further studies, particularly randomized controlled studies, are necessary to evaluate the utility of these biologic dressings, especially in the setting of acute surgical wounds.

In December 2012, AHRQ completed a technology assessment addressing *Skin Substitutes for Treating Chronic Wounds*. The assessment addresses 57 products currently available in the U.S. that are used to manage or treat chronic wounds and are regulated by FDA. Based on FDA regulations skin substitutes can be organized into four groups: human-derived products regulated as HCT/Ps, human- and human/animal-derived products regulated through PMA or HDE, animal-derived products regulated under the 510(k) process, and synthetic products regulated under the 510(k) process. One of the report’s goals was to begin to characterize the state of the evidence on skin substitutes as wound care products for chronic wounds. Eighteen RCTs examining only seven of the skin substitute products identified for the report met the inclusion criteria. The author’s evaluation of the clinical literature indicates that studies comparing the efficacy of skin substitutes to alternative wound care approaches are limited in number, apply mainly to generally healthy patients, and examine only a small portion of the skin substitute products available in the United States. The results of the available studies cannot be extended to other skin substitute products because of differences in active components in the various products. The studies available were not generalizable to the broader patient populations that are not as healthy as the patients in the studies. Also missing from the evidence base were studies that compared the various types of skin substitute products. Only two of the 18 studies compared two skin substitute products. How a human dermal substitute compares with a human derived skin substitute when treating a diabetic foot ulcer or a vascular leg ulcer is unknown. Such comparisons could be useful to clinicians trying to decide which wound treatment products to use. Additional studies in the area of wound care would be helpful to provide treatment data for many of the other skin substitute products, to allow better comparisons between wound care products, and to provide better information on wound recurrence when using skin substitute products.

Product Categories:

Acellular Dermal Matrices (ADM):

There is a small amount of evidence utilizing acellular dermal matrix products in breast reconstruction that does not show any difference in outcomes among the different types of ADM products.

A retrospective review compared complication rates following breast reconstruction with AlloDerm or FlexHD in 382 consecutive women (547 breasts). 81% of the patients underwent immediate reconstructions; 165 used AlloDerm, and

| SUBJECT: BIOENGINEERED TISSUE PRODUCTS FOR WOUND TREATMENT AND SURGICAL INTERVENTIONS POLICY NUMBER: 7.01.35 CATEGORY: Technology Assessment | EFFECTIVE DATE: 01/17/02 REVISED DATE: 01/16/03, 03/18/04, 01/20/05, 03/16/06, 12/21/06, 01/17/08, 02/19/09, 05/27/10, 08/18/11, 08/16/12, 07/18/13, 11/20/14, 12/17/15, 2/16/17, 04/19/18 PAGE: 11 OF: 22 |
|---|---|

97 used FlexHD. Mean follow-up was 6.4 months. Compared with breast reconstruction without use of AlloDerm or FlexHD, ADM had a higher rate of delayed healing (20.2% vs 10.3%), although this finding might be related to differences in fill volumes. In univariate analysis, there were no significant differences in complications (return to the operating room, surgical site infection, seroma, hematoma, delayed healing, or implant loss) between AlloDerm and FlexHD. In multivariate analysis, there were no significant differences between AlloDerm and FlexHD for the return to the operating room, surgical site infection, seroma, or delayed healing. Independent risk factors for implant loss included the use of FlexHD, single-stage reconstruction, and smoking. (Liu, et al, 2013).

Another retrospective review published in 2013 compared complication rates following use of AlloDerm (n=136) or FlexHD (n=233) in a consecutive series of 255 patients (369 breasts). Total complication rates for the two products were similar (19.1% for AlloDerm and 19.3% for FlexHD). Analysis by type of complication showed no significant difference between the products, and regression analysis controlling for differences in baseline measures found that the type of ADM was not a risk factor for any complication (Seth, et al, 2013).

A retrospective review of complication rates when AlloDerm (n=49), DermaMatrix (n=110), or FlexHD (n=62) was used for tissue expander breast reconstruction was published in 2012. Clinically significant complications were defined as cellulitis, abscess, seroma, expander leak or puncture, skin necrosis, wound dehiscence, or hematoma. The total clinically significant complication rate was 22% with AlloDerm, 15% with DermaMatrix, and 16% with FlexHD (not significantly different). Infectious complication rates for the 3 products were the same at 10%. When compared with breast reconstruction without an ADM (n=64), there was no significant difference in the total complication rate (17% vs 11%), but there was a trend toward a higher incidence of infectious complications (10% vs 2%, p=0.09) (Brooke, et al, 2012).

Amniotic Tissue Membrane:

Human amniotic membrane is classified by the U. S. Food and Drug Administration (FDA) as banked human tissue and therefore, it does not require FDA approval. Examples of amniotic tissue membrane include, but are not limited to, EpiFix® and Amniofix®. Results from small studies are encouraging, but preliminary. Further large, randomized, controlled studies are needed before conclusions can be made regarding the efficacy of these products.

A review article, published in 2015, addresses the use of human amnion/chorion membrane (dHACM) for lower extremity repair. The article states “although there are limited data available regarding most amniotic membrane-based products, there is substantial preclinical and clinical evidence supporting the rationale and effectiveness of dHACM allograft as a treatment modality. The rapidly growing body of evidence suggests that the properties inherent in dHACM promote tissue regeneration and healing, recruiting patients' own stem cells into the wounded area. Randomized controlled trials evaluating dHACM now include more than 200 patients collectively and the results consistently show improved healing. Use of dHACM has been shown to be more clinically effective and cost-effective than other frequently used advanced wound care products. This cost-effectiveness results from dHACM showing higher healing rates and more rapid healing than other advanced wound care products. Cost-effectiveness is also enhanced through the availability of grafts of multiple sizes, which reduces wastage, and through ease of handling and storage for clinical use. Ongoing and future studies will further define and establish the value of amniotic membrane for chronic tissue repair and regeneration.” (Zelen, et al, 2015).

A small, industry-sponsored, non-blinded, randomized, controlled trial comparing use of *EpiFix*® (n=13) with standard of care (SOC; moist wound therapy, n=12) for diabetic foot ulcers of at least 4 weeks' duration was published in 2013. *EpiFix* was applied every 2 weeks if the wound had not healed, with weekly dressing changes comprised of non-adherent dressing, moisture retentive dressing, and a compression dressing. Standard moist wound dressing was changed daily. After 4 weeks of treatment, *EpiFix* treated wounds had reduced in size by a mean of 97.1% compared with 32.0% for the SOC group. Healing rate (complete epithelialization of the open area of the wound) was 77% for *EpiFix* compared with 0% for SOC. After 6 weeks of treatment, wounds were reduced by 98.4% with *EpiFix* treatment compared with -1.8% for standard care. The healing rate was 92% with *EpiFix* compared with 8% with standard treatment alone (Zelen, et al, 2013).

|--|--|

Treatment with *EpiFix*®, *Apligraf*®, or standard wound care was compared in a multicenter randomized, controlled study. Sixty patients with chronic lower extremity diabetic ulcers were randomized to treatment with *Epifix* (dehydrated human amniotic membrane), *Apligraf* (human skin allograft with living fibroblasts and keratinocytes), or standard wound care. Although the patient and site investigator could not be blinded due to differences in products; wound healing was verified by 3 independent physicians who evaluated photographic images. The median wound size was 2.0 cm² (range, 1.0-9.0) and the median duration of the index ulcer was 11 weeks (range, 5-54). After 6 weekly treatments, the mean percent wound area healed was 97.1% for *EpiFix*, 80.9% for *Apligraf*, and 27.7% for standard care; 95% of wounds had healed in the *EpiFix* group compared with 45% treated with *Apligraf* and 35% who received standard wound care (p<0.003). The estimated median time to wound closure, based on Kaplan-Meier analysis, was 13 days for *EpiFix* compared with 49 days for both *Apligraf* and SOC (p<0.001). (Zelen, et al, 2014). Based on the updated Zelen, et. al. 2015 article, data was included on treatment of 226 diabetic foot ulcers from 99 wound care centers. Although wounds for the 2 groups were compared at baseline, the rationale for using a particular product was not reported. There were 163 wounds treated with *Apligraf* and 63 treated with *Epifix*®. By week 24, 72% of the wounds treated with *Apligraf*® and 47% of the wounds treated with *Epifix*® had closed. The median time to closure was 13.3 weeks for *Apligraf*® and 26.0 weeks for *Epifix*®.

In 2015, Kirsner et al reported an industry-sponsored observational study comparing the effectiveness of *Apligraf* and *EpiFix* in a real-world setting. 13 Data were obtained from a wound care-specific database from 3000 wound care facilities. The database included 1458 diabetic ulcers treated for the first time in 2014 with *Apligraf* (n=994) or *EpiFix* (n=464). *Using the same criteria as the 2015 study by Zelen (described above)*, data were included on the treatment of 226 diabetic foot ulcers from 99 wound care centers. Foot wounds were included with size between 1 cm² and 25 cm², duration of 1 year or less, and wound reduction of 20% or less in the 14 days prior to treatment. Although wounds for the 2 groups were comparable at baseline, the rationale for using a particular product was not reported. There were 163 wounds treated with *Apligraf* (mean, 2.5 applications) and 63 treated with *EpiFix* (mean, 3.5 applications, p=0.003). By week 24, 72% of wounds treated with *Apligraf* and 47% of wounds treated with *EpiFix* had closed (p=0.01). Median time to closure was 13.3 weeks for *Apligraf* and 26.0 weeks for Amniotic Membrane and Amniotic Fluid 7.01.149.

Treatment with *Grafix*® or standard wound care was compared in a small multi-centered RCT for diabetic foot ulcers. Although the results were positive, sample size is small *Grafix* (50) and SOC (47). The primary end point was complete wound closure by 12 weeks. *Grafix* patients who achieved full closure was 62% vs. 21% in the control group receiving SOC. There is no comparison to established products e.g. *Apligraf*. (Lavery et.al. 2014).

AmnioBand® was compared to SOC for treatment of non-healing diabetic foot ulcers in an industry sponsored multi-center study. 40 patients were randomized to SOC or SOC with *AmnioBand*®.for up to 12 weeks. Complete healing by 6 weeks was observed for 70% of wounds treated with SOC and *AmnioBand*®vs. 15% treated with SOC alone. At 12 weeks complete healing was observed in 85% of the SOC and *AmnioBand*® group vs. 25% treated with SOC alone. Limitations of the study were small sample size, 9/40 drop-out rate, and the wound area in control group was larger than treatment group.

The limited published, peer-reviewed, medical literature does not provide sufficient information to determine that the use of *Biovance*® has a definite, positive effect on health outcomes in treating lower extremity diabetic ulcers.

Products:

AlloDerm® is classified by the FDA as human tissue and is approved for use in burns and full-thickness wounds. There is limited scientific evidence in the form of retrospective case series to support the use of *AlloDerm*® in rare cases of non-primary hernia repair when chronic infection contraindicates the use of mesh or other conventional repair.

Although the literature investigating the use of *AlloDerm*® in breast reconstruction surgery consists of small case series that lack long-term data on effectiveness and safety, they all reach favorable conclusions. The use of *AlloDerm*® obviates many of the current disadvantages to implant breast reconstruction including thinning of muscle layer causing visible rippling and contour irregularities. In the multi-step processing of *AlloDerm*®, the epidermis and all the dermal

| <p>SUBJECT: BIOENGINEERED TISSUE PRODUCTS FOR WOUND TREATMENT AND SURGICAL INTERVENTIONS</p> <p>POLICY NUMBER: 7.01.35</p> <p>CATEGORY: Technology Assessment</p> | <p>EFFECTIVE DATE: 01/17/02</p> <p>REVISED DATE: 01/16/03, 03/18/04, 01/20/05, 03/16/06, 12/21/06, 01/17/08, 02/19/09, 05/27/10, 08/18/11, 08/16/12, 07/18/13, 11/20/14, 12/17/15, 2/16/17, 04/19/18</p> <p>PAGE: 13 OF: 22</p> |
|--|--|

cellular components are removed, leaving no reservoir for viral agents. As a result, no immune response is elicited after placement of the allograft.

Literature regarding the use of AlloDerm® in parotidectomy also consists of small case series; however they support that AlloDerm® is beneficial in preventing Frey’s syndrome after parotidectomy.

AlloPatch Pliable human reticular acellular dermis was compared to SOC in a 2016 industry-sponsored multicenter trial by Zelen et al. The trial was powered to detect a 45% difference between groups in percent healing at 6 weeks with 20 patients per group. Evaluation of the outcome measures was not blinded. At 6 weeks, 65% (13/20) of wounds treated with AlloPatch had healed compared to 5% (1/20) in the SOC-alone group (p<0.001). After adjusting for wound area at baseline, the hazard ratio for healing was 168 (95% CI, 10 to 2704; p<0.001), indicating a lack of precision in the estimate. Per protocol, 10 patients in the SOC group and 1 in the AlloPatch group exited the study at 6 weeks because their wounds failed to reduce in area by at least 50%. According to *intent-to-treat* (ITT) analysis with last observation carried forward, the percentage of wounds healed at 12 weeks was 80% in the AlloPatch group compared to 20% in the SOC group. However, because there was a high (50%) withdrawal rate in the SOC group, this result has a high risk of bias.

Biobrane® was granted pre-market approval by the FDA as a temporary covering of full-thickness burns until autografting is clinically appropriate.

Integra® *Dermal Regeneration Template* was granted pre-market approval by the FDA for use in post-excisional treatment of life-threatening full-thickness or deep partial-thickness thermal injuries where sufficient autograft is not available at the time of excision or not desirable due to the physiological condition of the patients, and for the repair of scar contractures when other therapies have failed or when donor sites for repair are not sufficient or desirable due to the physiologic condition of the patient. Evidence for use of *Integra* for contracture release procedures consists only of a retrospective case series without controls.

In January 2016, the U. S. Food and Drug Administration approved the use *Integra*® *Dermal Regeneration Template*, marketed as *Omnigraft*™, for use in the treatment of partial and full-thickness neuropathic diabetic foot ulcers that are greater than six weeks in duration, with no capsule, tendon, or bone exposes, when used in conjunction with standard diabetic ulcer care. Randomized, controlled studies have been shown to improve healing of chronic, non-healing diabetic foot ulcers with the use of *Omnigraft*™. The Foot Ulcer New Dermal Replacement Study (FOUNDER) multicenter study on the *Integra* Dermal Regeneration Template for chronic, non-healing diabetic foot ulcers was conducted under an FDA-regulated investigational device exemption. 307 patients with at least 1 chronic diabetic foot ulcer were randomized to treatment with the *Integra* Template or a control condition (0.9% sodium chloride gel). Treatment was given for 16 weeks or until wound closure. There was a modest increase in wound closure with the *Integra* Template (51% vs 32%) and a shorter median time to closure (43 days vs 78 days). There was a strong correlation between investigator-assessed and computerized planimetry assessment of wound healing (r=0.97). Kaplan-Meier analysis showed the greatest difference between groups in wound closure up to 10 weeks, with diminishing differences after 10 weeks. Strengths of the study included adequate power to detect an increase in wound healing of 18%, which was considered to be clinically significant, secondary outcomes of wound closure and time to wound closure by computerized planimetry, and intention-to-treat (ITT) analysis. (Driver, et. al., 2015)

Oasis® *Wound Matrix*, *Oasis*® *Burn Matrix*, and *Oasis*® *Ultra Tri-Layer Matrix* have FDA 510(k) approval in the management of wounds including partial and full thickness wounds, pressure ulcers, venous ulcers, diabetic ulcers, chronic vascular ulcers, tunneled undermined wounds, surgical wounds, trauma wounds, and draining wounds. (Cook Biotech) is a xenogeneic collagen scaffold derived from porcine small intestinal mucosa. *Oasis* Wound Matrix Niezgoda et al compared healing rates at 12 weeks for full-thickness diabetic foot ulcers treated with *OASIS* Wound Matrix (an acellular wound care product) to Regranex Gel.⁵⁴ This industry-sponsored, multicenter RCT was conducted at 9 outpatient wound care clinics and involved 73 patients with at least 1 diabetic foot ulcer. Patients were randomized to receive either *Oasis* Wound Matrix (n=37) or Regranex

| SUBJECT: BIOENGINEERED TISSUE PRODUCTS FOR WOUND TREATMENT AND SURGICAL INTERVENTIONS POLICY NUMBER: 7.01.35 CATEGORY: Technology Assessment | EFFECTIVE DATE: 01/17/02 REVISED DATE: 01/16/03, 03/18/04, 01/20/05, 03/16/06, 12/21/06, 01/17/08, 02/19/09, 05/27/10, 08/18/11, 08/16/12, 07/18/13, 11/20/14, 12/17/15, 2/16/17, 04/19/18 PAGE: 14 OF: 22 |
|---|---|

Gel (n=36) and a secondary dressing. Wounds were cleansed and débrided, if needed, at a weekly visit. The maximum treatment period for each patient was 12 weeks. After 12 weeks, 18 (49%) Oasis-treated patients had complete wound closure compared with 10 (28%) Regranex-treated patients. Oasis treatment met the noninferiority margin, but did not demonstrate that healing in the Oasis group was statistically superior (p=0.055). Post hoc subgroup analysis showed no significant difference in incidence of healing in patients with type 1 diabetes (33% vs 25%) but showed a significant improvement in patients with type 2 diabetes (63% vs 29%). There was also an increased healing of plantar ulcers in the Oasis group (52% vs 14%).

*PriMatrix*TM received FDA 510(k) approval in 2006 for the management of wounds that include: partial and full thickness wounds; pressure, diabetic and venous ulcers; second-degree burns; surgical wounds - donor sites/grfts, post-Moh's surgery, post-laser surgery, podiatric, wound dehiscence; trauma wounds - abrasions, lacerations, and skin tears; tunneled/undermined wounds; draining wounds.

Theraskin® was reported in a small (n=23) industry-funded randomized comparison of TheraSkin® (human skin allograft with living fibroblasts and keratinocytes) versus Dermagraft® (human-derived fibroblasts cultured on mesh) for diabetic foot ulcers. Wound size at baseline ranged from 0.5 to 18.02 cm²; the average wound size was about 5 cm² and was similar for the 2 groups (p=0.51). Grafts were applied according to the manufacturer's instructions over the first 12 weeks of the study until healing, with an average of 4.4 TheraSkin grafts (every 2 weeks) compared with 8.9 Dermagraft applications (every week). At week 12, complete wound healing was observed in 63.6% of ulcers treated with TheraSkin and 33.3% of ulcers treated with Dermagraft (p<0.049). At 20 weeks, complete wound healing was observed in 90.9% of the TheraSkin-treated ulcers compared with 66.67% of the Dermagraft group (p=0.428). (Sanders, et al, 2014). Further large, randomized, controlled studies are needed before conclusions can be made regarding the efficacy of Theraskin®.

ICD10:

- C07 Malignant neoplasm of parotid gland
- C50.011-C50.019 Malignant neoplasm of nipple and areola, right female breast (code range)
- C50.111-C50.119 Malignant neoplasm of central portion of female breast (code range)
- C50.211-C50.219 Malignant neoplasm of upper-inner quadrant of female breast (code range)
- C50.311-C50.319 Malignant neoplasm of lower-inner quadrant of female breast (code range)
- C50.411-C50.419 Malignant neoplasm of upper-outer quadrant of female breast (code range)
- C50.511-C50.519 Malignant neoplasm of lower-outer quadrant of female breast (code range)
- C50.611-C50.619 Malignant neoplasm of axillary tail of female breast (code range)
- C50.811-C50.819 Malignant neoplasm of overlapping sites of female breast (code range)
- C50.911-C50.919 Malignant neoplasm of unspecified site of female breast (code range)
- D05.00-D05.92 Carcinoma in situ of breast (code range)
- D11.0-D11.9 Benign neoplasm of major salivary gland (code range)
- D37.030-D37.039 Neoplasm of uncertain behavior of the salivary glands (code range)
- E10.10-E10.69 Type 1 diabetes mellitus with specified complication (code range)
- E11.00-E11.8 Type 2 diabetes mellitus with specified complication (code range)
- E11.9 Type 2 diabetes mellitus without complications
- E13.00-E13.9 Other specified diabetes mellitus with specified complication (code range)
- E13.9 Other specified diabetes mellitus without complications
